INTRODUCTION

Flo-tech turbine flow sensors measure the flow rate of hydraulic fluid and compatible liquids. Built to withstand rigorous hydraulic applications, these flow sensors are available in anodized aluminum and zinc plated Stressproof® steel bodies. Port types vary by body material, but include a choice of SAE, BSPP, Code 61 and Code 62, 4-bolt flanged options.

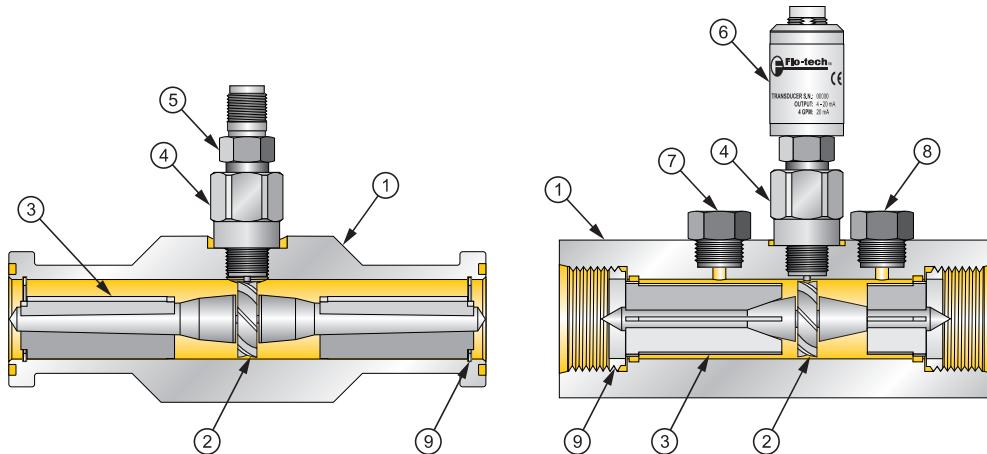

Typical applications for the turbine flow sensors include:

- Fluid characteristic measurement on test stands
- Stationary hydraulic system monitoring
- Feedback for hydraulic system control
- Advance warning of impending component failure
- Mobile hydraulic system diagnosis

Flo-tech offers four different flow sensor models. Each of these models is available in a wide selection of flow ranges and port sizes.

Activa Sensor Array	Classic Flow Sensor
 <p>Features:</p> <ul style="list-style-type: none"> • Four flow ranges • Four port sizes • Accuracy of $\pm 1\%$ reading @ 32 cSt • Pressures up to 5800 psi (400 bar) • Temperatures up to 300° F (150° C) • 4...20 mA or 0...5V DC output for flow • 4...20 mA output for pressure and temperature 	 <p>Features:</p> <ul style="list-style-type: none"> • Eight flow ranges • Eight port sizes • Accuracy of $\pm 1\%$ full scale • Pressures up to 6000 psi (414 bar) • Temperatures up to 300° F (150° C) • Frequency output for flow
 <p>Ultima Sensor Array</p> <p>Features:</p> <ul style="list-style-type: none"> • Four flow ranges • Four port sizes • Accuracy of $\pm 1\%$ full scale • Pressures up to 5800 psi (400 bar) • Temperatures up to 300° F (150° C) • Frequency output for flow • 4...20 mA output for pressure and temperature 	 <p>Quad Flow Sensor</p> <p>Features:</p> <ul style="list-style-type: none"> • Four flow ranges • Two port sizes • Accuracy of $\pm 1\%$ full scale • Pressures up to 6000 psi (414 bar) • Temperatures up to 300° F (150° C) • Frequency output for flow

OPERATING PRINCIPLE

1	Housing	6	Signal Converter (analog output)
2	Turbine Rotor	7	Pressure Port Adapter
3	Rotor Supports	8	Temperature Port Adapter
4	Lock Nut	9	Retaining Rings
5	Magnetic Pickup (frequency output)		

Turbine flow sensors measure the flow rate of hydraulic fluid and compatible liquids. As fluid flows through the sensor it turns the turbine rotor, and as the turbine blades pass the magnetic pickup a frequency signal is generated. This frequency signal is proportional to the flow rate and can be transmitted to Flo-tech's digital displays or converted to an analog output. Optional sensors allow measurement of pressure and temperature.

INSTALLATION

CAUTION

THIS PRODUCT SHOULD BE INSTALLED AND SERVICED BY TECHNICALLY QUALIFIED PERSONNEL TRAINED IN MAINTAINING INDUSTRIAL CLASS FLOW INSTRUMENTATION AND PROCESSING EQUIPMENT.

CAUTION

READ INSTRUCTIONS THOROUGHLY BEFORE INSTALLING THE FLOW SENSOR. IF YOU HAVE ANY QUESTIONS REGARDING PRODUCT INSTALLATION OR MAINTENANCE, CALL YOUR LOCAL SUPPLIER OR THE FACTORY FOR MORE INFORMATION.

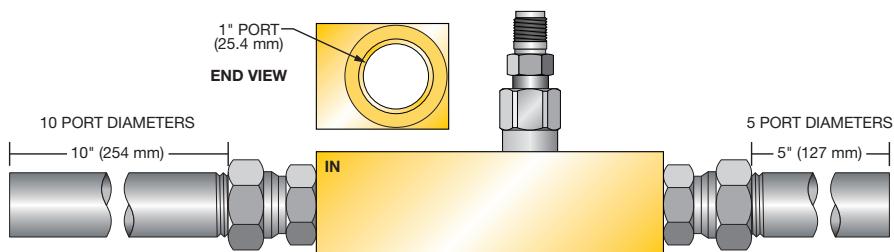

WARNING

DO NOT USE MALE PIPE THREADS (NPT) INTO SAE STRAIGHT THREAD PORTS. USING MALE PIPE THREADS (NPTF) WITH A FLOW SENSOR POSSESSING SAE STRAIGHT THREAD O-RING PORTS WILL NOT CREATE A PROPER SEAL AND IS POTENTIALLY DANGEROUS. PIPE THREADS INSERTED INTO AN SAE STRAIGHT THREAD PORT ONLY ALLOW THE ENGAGEMENT OF ONE OR TWO THREADS. NO AMOUNT OF TIGHTENING OR THREAD SEAL WILL STOP THE LEAKING OR MAKE THE INSTALLATION SAFE. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN SERIOUS PERSONAL INJURY OR DEATH AND/OR DAMAGE TO THE EQUIPMENT.

Installation Recommendations

The in-line flow sensor is a simple device to install. However, the following measures are recommended for reliable, trouble-free operation:

1. Provide at least 10 port diameters of upstream straight pipe with no obstructions to the flow sensor and at least 5 port diameters of downstream pipe. The pipe should be of the same diameter as the nominal port size.

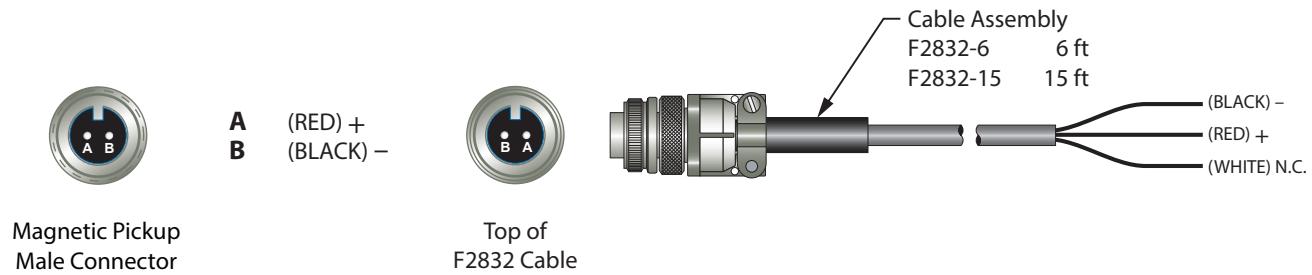

Example:

An FSC-1000 has a 1 in. (25.4 mm) port. The unobstructed upstream length should be at least 10 in. (254 mm) and the downstream length should be at least 5 in. (127 mm).

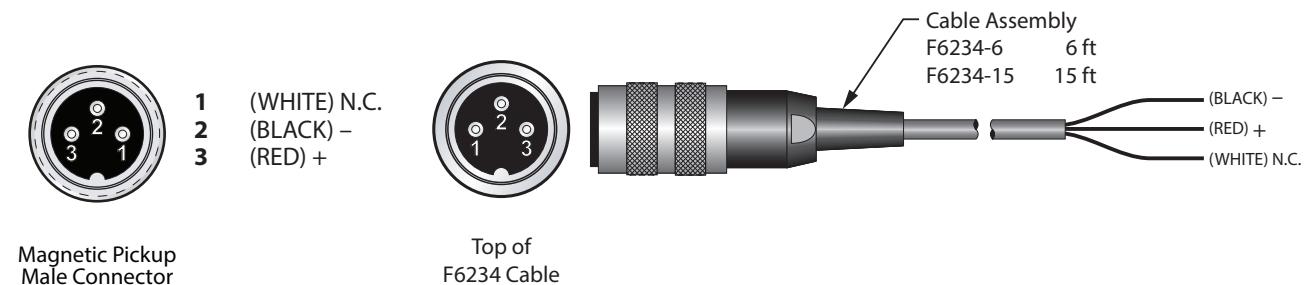

2. Choose a position for the flow sensor that is not at the lowest level in the system. Placing the flow sensor at a higher elevation in the system will avoid collection of debris, sediment and dirt in the flow sensor.
3. Use a filter. All applications should be filtered to at least 40 micron.
4. Do not install a flow sensor directly in-line with the outlet of a pump, as pressure pulsations can react with the turbine. Install the sensor after another component, observing the 10 port diameter rule.
5. Do not adjust the magnetic pickup on the flow sensor. This is calibrated at the factory. Further adjustment will cause a decrease in performance or damage to the sensor.
6. Do not exceed the working temperature range of $-4\dots300^\circ\text{ F}$ ($-20\dots150^\circ\text{ C}$). Higher temperatures will damage the magnetic pickup and lower temperatures will limit the rotation of the turbine.

Electrical Connections for Standard Magnetic Pickup

Standard Magnetic Pickup with Frequency Output, 2-pin Connector

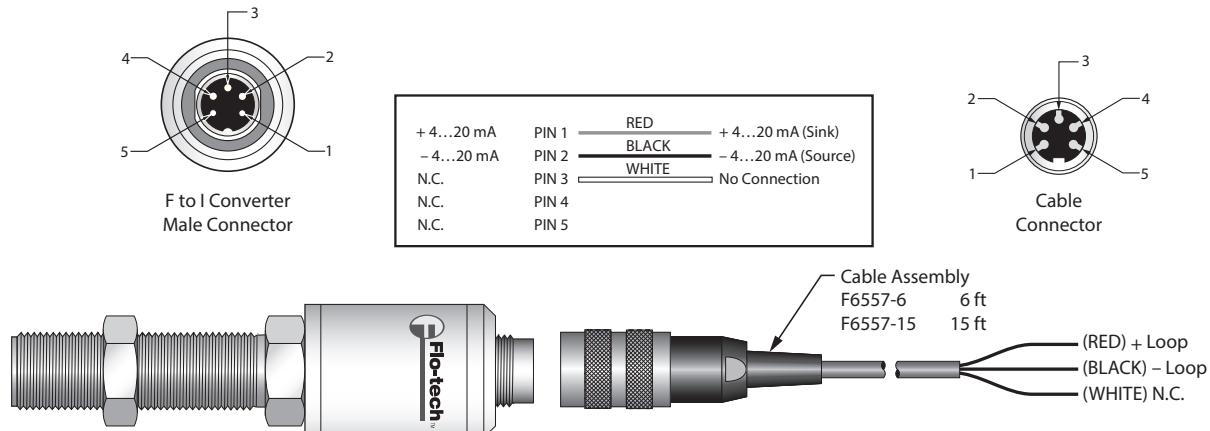

Standard Magnetic Pickup with Frequency Output, 3-pin Connector

Electrical Connections for IFC (Intelligent Frequency Converter)

IFC with 4...20 mA Output (F to I), 5-pin Connector

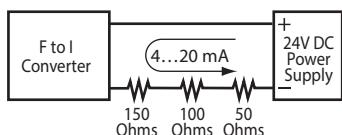

The 4...20 mA output can drive auxiliary devices (resistive loads) such as displays, recorders and computers, provided that the voltage supplied by the power supply is adequate. Devices must be wired in series with the F to I converter and power supply. The voltage drop across the load(s) and the 6V DC minimum needed to drive the F to I converter determine the minimum voltage required from the power supply.

Determine the necessary voltage required to adequately drive the F to I converter and auxiliary device(s).

The F to I converter acts as a current controlling device keeping the current output the same even if the power supply voltage fluctuates or the load resistance changes. The current varies only with respect to the flow rate from the turbine flow sensor, as long as the voltage drop across the F to I converter is at least 6V DC.

The load(s) in the circuit will generally have some electrical resistance, 100 Ohms for this example. The 4...20 mA loop current will produce a voltage drop across each load. The maximum voltage drop across a load(s) will exist when the loop current is 20 mA. The power supply must provide enough voltage for the load(s) plus the 6V DC minimum insertion loss of the F to I converter.

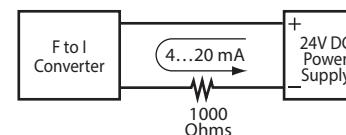

Example 1 Sufficient Power Supply Voltage

Total Load Resistance = 300 Ohms
At 20 mA loop current, the voltage drop across the load(s) is 6 volts:
 $300 \text{ Ohms} \times 20 \text{ mA} = 6000 \text{ mV} \text{ or } 6 \text{ volts}$

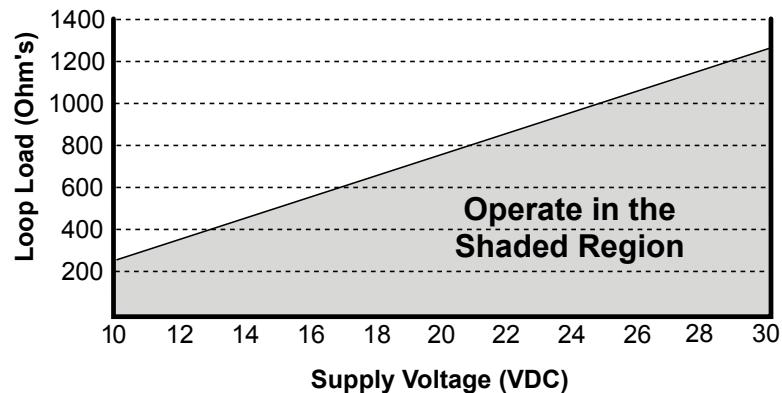

Subtract 6 volts from the 24 volt source to determine that 18 volts is available to power the F to I converter. The 18 volts is within the specified 10...30 volt range and is sufficient to power the F to I converter.

Example 2 Insufficient Power Supply Voltage

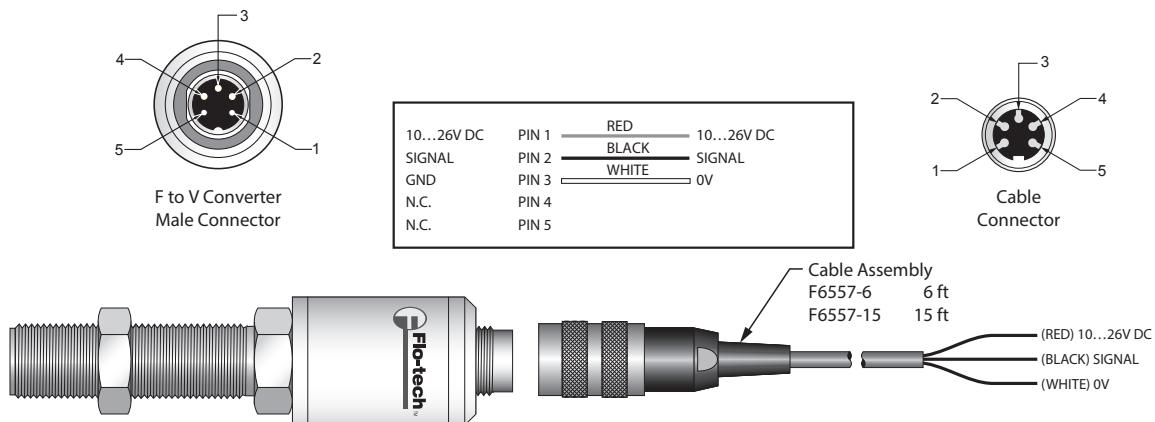

Total Load Resistance = 1000 Ohms
At 20 mA loop current, the voltage drop across the load(s) is 14 volts:
 $1000 \text{ Ohms} \times 20 \text{ mA} = 20,000 \text{ mV} \text{ or } 20 \text{ volts}$

Subtract 20 volts from the 24 volt source to determine that 4 volts is available to power the F to I converter. The 4 volts is below the specified 10...30 volt range and is not adequate to power the F to I converter. If for example, the power supply voltage was 30 volts instead of 24 volts, the voltage available to power the F to I converter would be 10 volts and within the specified range.

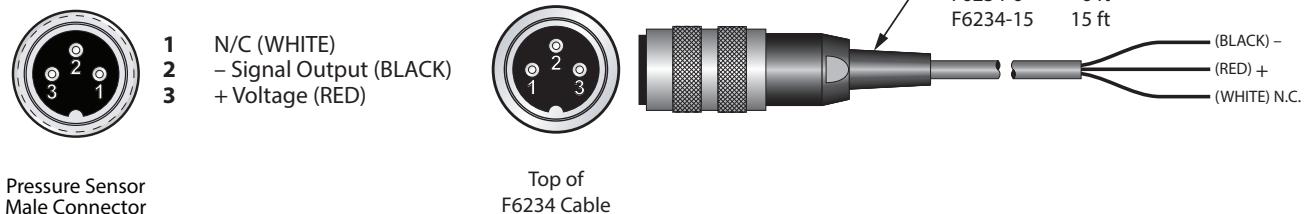

IFC with 0...5V DC Output (F to V), 5-pin Connector

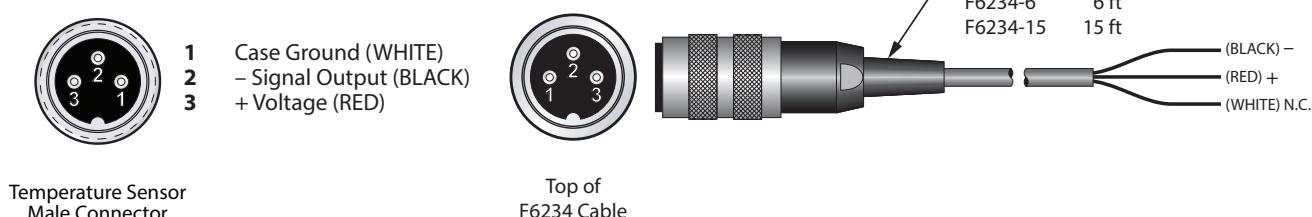

Electrical Connections for Optional Pressure and Temperature Sensors

Pressure Sensor, Optional, 3-pin Connector

Temperature Sensor, Optional – 3-pin Connector

OPERATION

General

⚠ WARNING

DO NOT EXCEED ALLOWABLE PRESSURE RATINGS. PRESSURE IN EXCESS OF THE MAXIMUM ALLOWABLE RATINGS MAY CAUSE THE TURBINE BODY TO FAIL. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN SERIOUS PERSONAL INJURY OR DEATH AND/OR DAMAGE TO THE EQUIPMENT.

1. Allow fluids to warm to operating temperatures before critical measurements are taken.
2. Maintain a flooded condition in the flow sensor at all times. Air and turbulence will result in erroneous readings.
3. Do not exceed the working temperature range of $-4\dots300^\circ\text{ F}$ ($-20\dots150^\circ\text{ C}$). Higher temperatures will damage the magnetic pickup and lower temperatures will limit the rotation of the turbine.

Flow Sensors with IFC Option

As soon as power is applied, the IFC will begin to output an analog value representative of the measured frequency from the turbine meter. See the wiring diagram that corresponds to the IFC being used.

MAINTENANCE

⚠ WARNING

ALWAYS DISCONNECT THE PRIMARY POWER SOURCE BEFORE INSPECTION OR SERVICE. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN SERIOUS PERSONAL INJURY OR DEATH AND/OR DAMAGE TO THE EQUIPMENT.

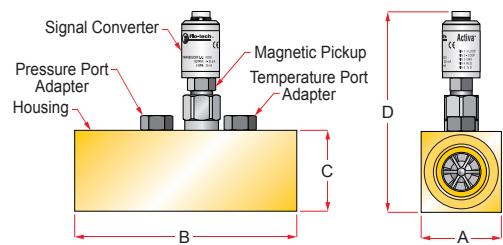

1. A schedule for maintenance checks should be determined based on environmental conditions and frequency of use. Inspect the sensors at least once a year.
2. Perform visual, electrical and mechanical checks on all components.
 - a. Visually check for undue heating evidenced by discoloration of wires or other components, damaged or worn parts, or excessive corrosion of the device.
 - b. Electrically check to make sure that all connections are clean and tight and that the device is operating properly.

TROUBLESHOOTING

Issue	Possible Cause	Remedy
Sensor indicates higher than actual flow rate	<ul style="list-style-type: none"> • Cavitation • Debris on straightening section • Build-up of foreign material on sensor bore • Gas in liquid 	<ul style="list-style-type: none"> • Increase back pressure • Clean sensor • Clean sensor • Install gas eliminator ahead of sensor
Sensor indicates lower than actual flow rate	<ul style="list-style-type: none"> • Debris on turbine • Worn bearing 	<ul style="list-style-type: none"> • Clean sensor and add filter • Have sensor serviced and add filter
Erratic indications on readout	<ul style="list-style-type: none"> • Any of the above • Ground loop problem • Turbulence in fluid stream 	<ul style="list-style-type: none"> • Any of the above • Be sure only one system ground is present. Reroute cables away from electrical noise • Redo plumbing per instructions
Readout shows flow when pumps are not running	<ul style="list-style-type: none"> • Mechanical vibration or pump dither causes turbine to oscillate even though there is no flow 	<ul style="list-style-type: none"> • Isolate flow sensor
No flow indication at any flow rate	<ul style="list-style-type: none"> • Foreign material stopping turbine rotation • Damaged turbine and/or bearing • Magnetic pickup stopping turbine rotation • Magnetic pickup shorted or open 	<ul style="list-style-type: none"> • Clean sensor and add filter • Have sensor or magnetic pickup replaced
Erratic indications at low flows, but good indications at high flows	<ul style="list-style-type: none"> • Foreign material wrapped around turbine 	<ul style="list-style-type: none"> • Clean sensor and add filter
System works except readings are lower than expected	<ul style="list-style-type: none"> • Flow is being bypassed • System has a leak 	<ul style="list-style-type: none"> • Repair or replace faulty valves • Find and repair any system leaks
No current output	<ul style="list-style-type: none"> • Low or missing supply voltage • Broken / disconnected wires • Incorrect wiring polarity 	<ul style="list-style-type: none"> • Check polarity of the current loop connections for proper orientation • Make sure receiving device is configured to provide loop current
Analog output reads a constant reading all the time	<ul style="list-style-type: none"> • Electrical noise in vicinity • Damaged electronics 	<ul style="list-style-type: none"> • Make sure there is flow in the system • Verify that the rotor inside the turbine meter turns freely • Check shield • Remove noise producing device
Analog output is not stable	<ul style="list-style-type: none"> • Electrical noise in vicinity • Entrained gas in liquid • Damaged meter rotor • Foreign matter lodged in turbine 	<ul style="list-style-type: none"> • External noise is being picked up by the sensor. Keep all AC wires separate from DC wires. • Check for radio antenna in close proximity. This usually indicates a weak signal. • Clean meter • Recalibrate meter
